

S11FBC-B70-1B

0802 Right-Angle Blue SMD LED

2.1 × 0.6 mm (0802) Side-View Mono-Color Chip LED Indicator

Features

- High brightness
- Low power consumption
- Wide viewing angle and water-clear lens
- Compatible with automatic placement and IR / vapor-phase reflow soldering
- Standard 2.1 × 0.6 mm / 0802 / 2106 side-view SMD package
- Packaged in 8mm tape on 7-inch reel for automated handling
- RoHS and EU REACH compliant

Description

The S11FBC-B70-1B is a compact 2.1 × 0.6 mm side-view blue SMD chip LED with right-angle light output. Its ultra-compact package is suitable for space-limited PCB layouts and compact front-panel designs. It offers low power consumption, wide viewing angle, and compatibility with automated SMT assembly and IR reflow soldering processes.

Applications

- Status and diagnostic indicators
- Backlighting for switches, symbols, and small displays
- Networking, telecom, and IT infrastructure
- Industrial control panels and automation equipment
- Home appliances and smart consumer electronics
- Handheld and portable electronic devices

Selection Guide

Part No.	Emitting Color	Lens Color
S11FBC-B70-1B	Blue	Water Clear

Package Dimensions

Polarity

Recommended Soldering Pad Dimensions

Notes:

1. All dimensions are in millimeters (inches).
2. Tolerance is ± 0.10 mm (.004") unless otherwise noted.

Absolute Maximum Ratings ($T_a = 25\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Max.	Unit
Power Dissipation	P_D	85	mW
Peak Forward Current ¹	I_{FP}	100	mA
DC Forward Current ²	I_F	25	mA
Reverse Voltage	V_R	5	V
Operating Temperature Range	T_{opr}	-40 to +85	$^{\circ}\text{C}$
Storage Temperature Range	T_{stg}	-40 to +85	$^{\circ}\text{C}$
Soldering Temperature (5 s)	T_{sld}	260	$^{\circ}\text{C}$

Notes:

1. Duty Factor = 10%, Frequency = 1 kHz.
2. Derate linearly as shown in the derating curve.

Electrical / Optical Characteristics (T_a = 25 °C)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Test Condition
Luminous Intensity ¹	I _V	20	34	-	mcd	I _F = 5 mA
		45	75		mcd	I _F = 10 mA
Viewing Angle ²	2θ _½	-	130	-	deg.	I _F = 5 mA
Peak Emission Wavelength	λ _p	-	465	-	nm	I _F = 5 mA
Dominant Wavelength ³	λ _d	-	470	-	nm	I _F = 5 mA
Spectral Line Half-Width	Δλ	-	20	-	nm	I _F = 5 mA
Forward Voltage	V _F	2.6	2.8	3.1	V	I _F = 5 mA
Reverse Current	I _R	-	-	10	μA	V _R = 5 V

Notes:

1. Luminous intensity (I_V) is measured using a light sensor and filter combination that approximates the CIE eye-response curve, with a measurement tolerance of ±15%.
2. 2θ_½ is the off-axis angle where the luminous intensity is half of the peak intensity.
3. The dominant wavelength (λ_d) is derived from the CIE chromaticity diagram and represents the single wavelength that defines the perceived color of the device.

Typical Electrical / Optical Characteristics Curves (Ta = 25 °C)

Reel & Carrier Tape Dimensions

Standard Packing Quantity (SPQ): 4000 pcs per reel.

Precautions

1. Circuit Design & Over-Current Protection

LEDs are current-operated devices. A current-limiting resistor must be connected in series with each LED. A small voltage shift can cause a large change in current, which may result in device failure or permanent burnout.

2. Storage & Moisture Control

- Do not open the moisture-proof bag until the products are ready to use.
- Before opening, store the LEDs at 30 °C or less and 60% RH or less.
- After opening, store at 30 °C or less and 60% RH or less and use within 168 hours.
- If the desiccant has changed color or the storage time has been exceeded, perform baking at 65 ± 5 °C for 24 hours before use.
- Avoid rapid ambient temperature transitions, particularly in high-humidity environments where condensation may occur.

3. Handling

Handle the component by its side surfaces using forceps or appropriate tooling. Do not apply mechanical stress to the lens surface during assembly. Use ionizing blowers to neutralize static charges that may accumulate on the lens during handling.

4. Soldering

Reflow soldering should not be performed more than twice. Do not apply stress to the LED during heating, and do not warp the circuit board after soldering. Excessive soldering temperature or duration may result in deformation of the lens or cause catastrophic failure of the device.

Pb-Free Reflow Temperature Profile

Reflow Soldering — Time / Rate Parameters

Parameter	Recommended Condition
Start temperature	25 °C
Preheat / soak range	150°C to 200°C
Preheat / soak time	120 s max
Liquidus temperature	217°C
Time above liquidus	100 s max
Recommended peak temperature	245°C ±5°C
Maximum peak temperature	260°C +0/-5°C
Ramp-up rate	3 K/s max
Ramp-down rate	6 K/s max
Time near peak	10 s max

Soldering Iron (Manual / Rework)

Parameter	Limit
Tip temperature	300 °C Max. (25 W Max.)
Soldering time	3 sec. Max. (One time only)

Note:

Because board designs, solder pastes, reflow ovens, and PCBs differ, no single temperature profile suits all combinations. Verify the profile with PCB-specific characterization.

5. Drive Method

To ensure luminous-intensity uniformity across multiple LEDs connected in parallel, incorporate a dedicated current-limiting resistor in series with each individual LED, as shown in Circuit A below.

A. Recommended circuit.

B. LED brightness may vary due to variations in individual I-V characteristics.

6. Rework

Rework should generally be avoided once the LEDs have been soldered. If rework is unavoidable, use a dual-head soldering iron and verify beforehand that the process will not degrade the electrical or optical characteristics of the LED.

7. Electrostatic Discharge (ESD)

Static electricity and surge voltage can damage the LED. Wear a conductive wrist strap or anti-static gloves, ensure all equipment and workbenches are properly grounded, and use ionizing blowers where appropriate. ESD-damaged LEDs may exhibit increased reverse leakage current, reduced forward voltage, or failure to illuminate at low currents.

To verify ESD damage, check forward voltage and illumination at low current. An undamaged LED should exhibit $V_F > 1.4 \text{ V @ } 0.1 \text{ mA}$ (AlInGaP) for this product family.

Disclaimers

The information provided in this document reflects representative usage scenarios and is intended for technical reference only.

Part numbers, product types, and specifications are subject to change or improvement without prior notice. Prior to mass production or design-in, customers must consult the latest version of the datasheet to verify the most up-to-date specifications.

When deploying the products referenced herein, ensure they are operated strictly within the environmental and electrical limits specified in this datasheet. LuckyLight assumes no liability or responsibility for any issues, malfunctions, or damages resulting from operation outside these specified limits.

The LEDs described in this document are intended for standard electronic equipment such as office automation, communication equipment, and general consumer electronics. For applications requiring exceptional reliability and safety—where a failure could directly jeopardize life or health, such as aviation, transportation, traffic control, medical life-support systems, or safety devices—please contact LuckyLight sales representatives in advance for technical consultation.
